## 1.1 Solution Summary

SecurEnvoy's SecurAccess MFA solution integrates with Citrix Netscaler appliance through the use of RADIUS Server for authorisation and access control.

*The software used for the integration process is listed below:*

Citrix Netscaler VPX (1000)<sup>®</sup> NS12.1 48.13.nc  
SecurEnvoy SecurAccess Release v9.3.502

## 1.2 Guide Usage

The information in this guide describes the configuration required for integration with SecurEnvoy and common to most deployments. It is important to note two things:

- Every organization is different and may require additional or different configuration.
- Some configuration may have other methods to accomplish the same task than those described.

## 1.3 Prerequisites

The following conditions are required to set up SecurEnvoy's MFA Solution:

- A SecurAccess MFA server installed, configured and working on a system with:
  - Windows Server 2003 or higher.
  - An LDAP or Lightweight Directory Service database of users

*Note: Please see SecurEnvoy's SecurAccess version 9.3 deployment guide on how to setup MFA server solution (On the [www.securenvoy.com](http://www.securenvoy.com) website)*
- A Citrix Netscaler (Physical, Virtual) running version 12.0 and above, (previous versions of Netscaler may work but have not been tested with full functionality)
- This guide assumes that Citrix Netscaler has been installed and previously configured to authenticate users successfully with a username and password through LDAP.
- Familiarity with the following technologies:
  - RADIUS configuration
  - Citrix Netscaler Administration Interface

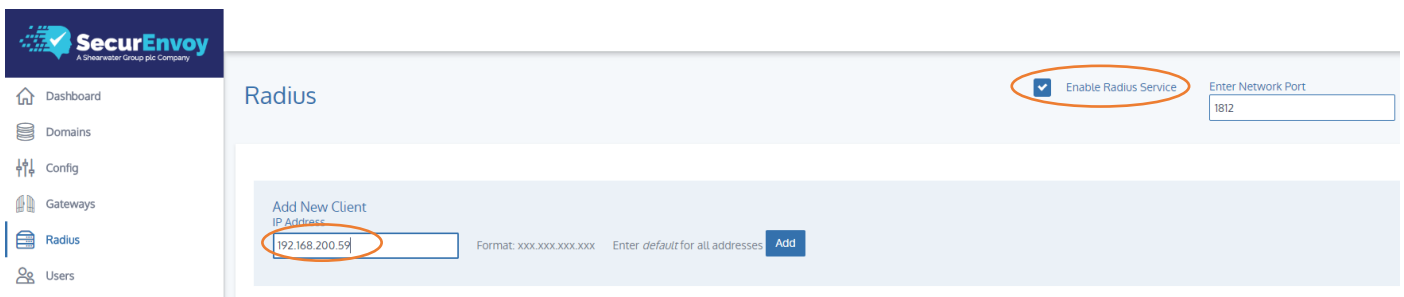

## 1.4 Authentication

The following section describes the steps required to configure both the Netscaler appliance to authenticate users via RADIUS through the SecurEnvoy SecurAccess Solution.

### 1.4.1 Setup RADIUS - SecurAccess

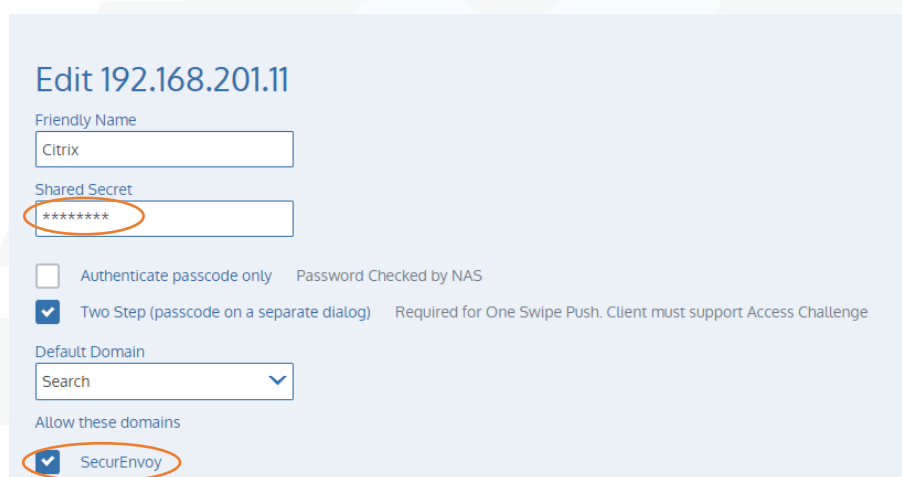

Within the SecurAccess configuration, we will need to configure the Pulse connect Secure appliance as an authorised RADIUS client.

- Navigate to RADIUS in the administrator dashboard.
- Ensure the RADIUS Service is enabled in the top right-hand side of the screen and make sure the port number is left as default 1812.
- Enter the IP address of the Netscaler Appliance and click "Add"

The screenshot shows the SecurEnvoy administrator dashboard. On the left is a navigation menu with 'Radius' selected. The main content area is titled 'Radius'. In the top right corner, there is a checkbox labeled 'Enable Radius Service' which is checked and circled in orange. To its right is a text input field labeled 'Enter Network Port' containing the value '1812'. Below this, there is a section for 'Add New Client'. It features a text input field for 'IP Address' containing '192.168.200.59', which is circled in orange. To the right of this field is the text 'Format: xxx.xxx.xxx.xxx' and 'Enter default for all addresses'. A blue 'Add' button is located to the right of the IP address field.

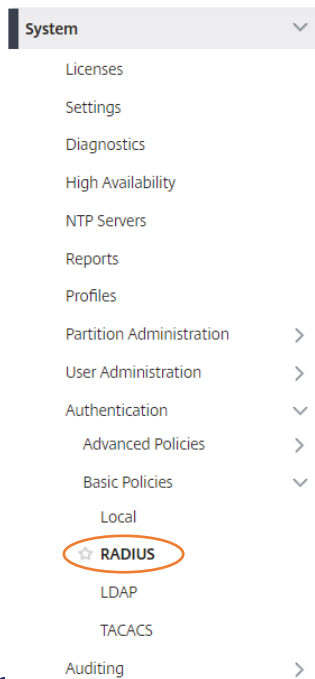

- Enter in a shared secret or common password and select the domains that will be authenticated against (if there is more than one domain configured in SecurAccess)
- Click Update

The screenshot shows the 'Edit 192.168.201.11' configuration page. It includes several fields: 'Friendly Name' with the value 'Citrix'; 'Shared Secret' with the value '\*\*\*\*\*', which is circled in orange; a checkbox for 'Authenticate passcode only' (unchecked) with the text 'Password Checked by NAS'; a checked checkbox for 'Two Step (passcode on a separate dialog)' with the text 'Required for One Swipe Push. Client must support Access Challenge'; a 'Default Domain' dropdown menu currently showing 'Search'; and a section titled 'Allow these domains' with a checked checkbox for 'SecurEnvoy', which is also circled in orange.

## 1.42 Setup RADIUS – Netscaler

Navigate to System\Authentication\Basic Policies\RADIUS within the Netscaler administration portal.

Select RADIUS from the drop-down list and click Add to define a new RADIUS Authentication Server.

Select RADIUS Server from the drop-down list and select New Server, to configure a new authentication Server.

On presentation of the RADIUS Server dialogue box, complete the details as highlighted below, making sure you enter the shared secret password set in the last section.

Name: Provide the Server with a unique, but identifiable name

Server Name or Sever IP

IP Address: Set the IP address of the SecurAccess Server

Port: Make sure the port number matches the port set on the SecurAccess RADIUS page

Shared Key: Make sure the Shared key matches the key defined in the last section

Timeout: Timeout should be higher than the timeout set in SecurAccess for PUSH notifications

#### Configure Authentication RADIUS Server

Click OK to apply the settings.

RADIUS

Policies 1 Servers 1

| Name             | Expression |
|------------------|------------|
| SE_Radius_Policy | ns_true    |

We will now need to define a policy against the newly created RADIUS Server.

Click on the Policies tab and select Add to create a new policy.

#### Configure Authentication RADIUS Policy

Name: Set a name for the Policy

Server: Select drop down list and select the server we created in the last step.

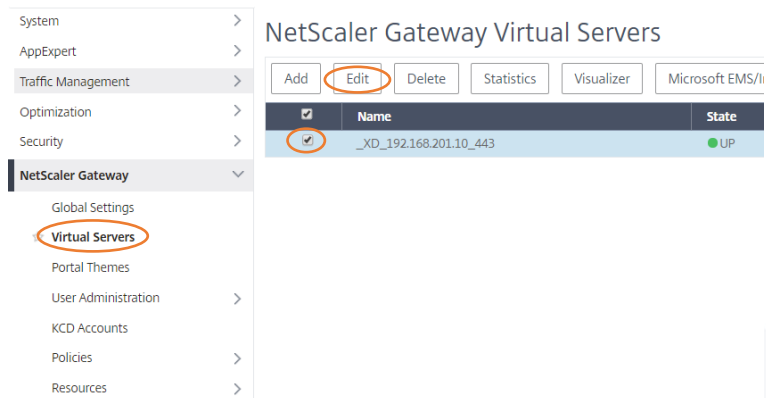

Expression: Select middle drop-down list and select ns\_true and click OK to complete.

## 1.43 Virtual Server – Authentication Policy

Once we have defined both the RADIUS Authentication server and policy, we will assign to the existing Virtual Server.

Navigate to Netscaler Gateway\Virtual Servers and select the existing Virtual Server that is authenticating users through AD username and password.

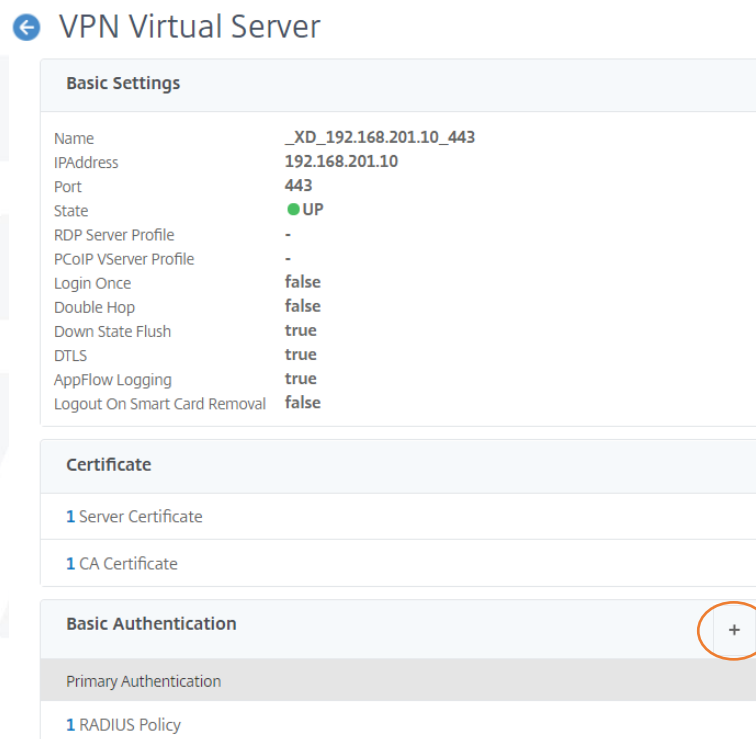

Click Edit

NetScaler Gateway Virtual Servers

| Name                   | State |
|------------------------|-------|
| _XD_192.168.201.10_443 | UP    |

We will now look to edit the Basic Authentication Policy and change the existing LDAP policy to a RADIUS method.

VPN Virtual Server

**Basic Settings**

|                              |                        |
|------------------------------|------------------------|
| Name                         | _XD_192.168.201.10_443 |
| IPAddress                    | 192.168.201.10         |
| Port                         | 443                    |
| State                        | UP                     |
| RDP Server Profile           | -                      |
| PCoIP VServer Profile        | -                      |
| Login Once                   | false                  |
| Double Hop                   | false                  |
| Down State Flush             | true                   |
| DTLS                         | true                   |
| AppFlow Logging              | true                   |
| Logout On Smart Card Removal | false                  |

**Certificate**

- 1 Server Certificate
- 1 CA Certificate

**Basic Authentication**

Primary Authentication

- 1 RADIUS Policy

Locate and click on the plus sign to add a new authentication policy

Select RADIUS policy and Primary Type and select Continue.

### Choose Type

**Policies**

Choose Policy\*  
RADIUS

Choose Type\*  
Primary

Select Add Binding

### Choose Type

**Policies**

Choose Policy  
RADIUS

Choose Type  
Primary

| Priority | Policy Name | Expression |
|----------|-------------|------------|
| No items |             |            |

And select the RADIUS policy by selecting the Policy drop-down list and clicking Bind

### Policy Binding

Select Policy\*  
Click to select

**Binding Details**

Priority\*  
100

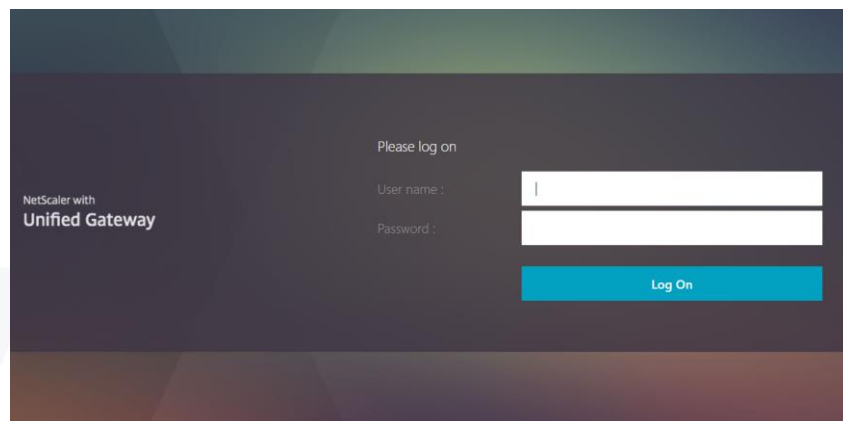

*B*  
Be sure to remove the existing LDAP Authentication server from the Virtual Server and click the Save button at the top right of the screen.

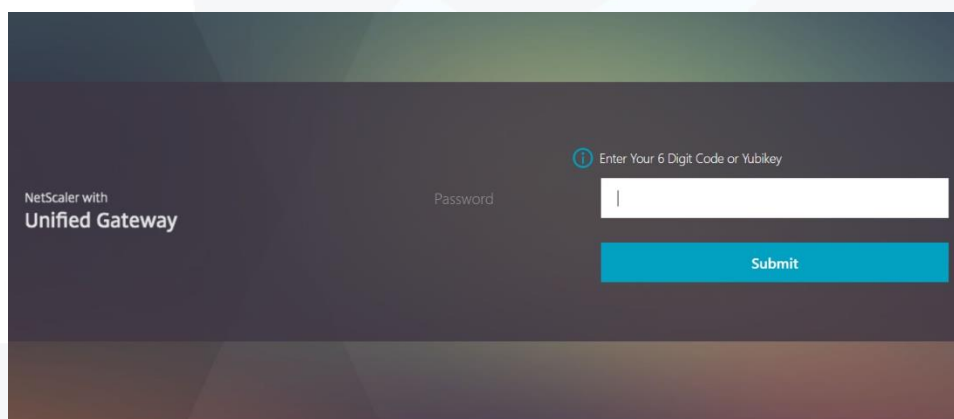

## 1.5 Client Logon

The following section describes the login process and demonstrates what will be presented back to the user.

- Browse to your Netscaler Virtual IP or hostname
- Enter in your username from Active Directory or Local Directory Service account
- Enter your domain password and click Log On

- Dependent on the authentication type you have configured within SecurAccess, you will either receive a PUSH notification to your Apple or Android phone or presented with a login page requesting the 6-digit token (Received via SMS or Email)
- Enter the one-time code received or enter the code from the soft token or Yubikey.

Once entered, you will be taken to your Citrix StoreFront Server.
